

General

TA SHUNT is a range of shunt valve groups which meet most requirements.

Examples of applications where TA SHUNT is suitable:

- Radiator systems
- Floor heating systems
- Ventilation heat exchangers
- Heating and cooling systems
- Heat re-cycling systems etc.

Technical description

Applications:

TA SHUNT is made for the following types of control circuits:

1. Constant flow in primary and secondary circuit.
2. Variable flow in primary circuit and constant flow in secondary circuit.
3. Variable flow in primary circuit and constant flow in secondary circuit for installations without a main pump.
4. Constant flow in primary and secondary circuit and where the control valve loads the secondary circuit, so-called Norwegian coupling.
5. Water-borne heat recycling with variable flow in the air inlet circuit and constant flow in the outlet air circuit.
6. Variable flow in primary circuit and constant flow in secondary circuit (SABO coupling)

TA SHUNT can be used in systems with up to 50% glycol content.

Pressure class:

PN 6

All components in the shunt valve group are classified to at least PN 6. If PN 10 is needed, please specify this when ordering.

Temperature:

Max media temperature: 95°C (120°C optional).

Min media temperature: -10°C

For media temperatures below 0°C and glycol water mixture, control valves V221, V295 and V395 must be equipped with seal Q.

V354 must not be used with a glycol/water mixture.

Certain makes of pump also require special versions.

Union dimension:

DN 20 - 100

Gate and ball valves:

DN 20-50: TA 500 Ball valve

DN 65-100: TA 60 Gate valve

Balancing valves:

DN 20-50 STAD

DN 65-100 STAF

Control valves:

2-way: V354, V241, V221, V295

3-way: V354, V341 and V395-1.

Kvs control valves:

0,25 - 160 in the Renard series.

Pipe packages:

DN 20-50 according to ISO 65 (Carbon steel tubes suitable for screwing in accordance with ISO 7/1).

DN 65-100 pressure vessel pipes, seamless Stainless steel or copper pipe packages can be tendered on request.

Thermometers:

Graduated 0-120 °C for heating. -40 °C - +40 °C for cooling/recycling.

Insulation:

Heating: non-combustible mineral wool

Cooling: Armaflex condensate insulation

Protective box:

DN 20-100: Plastic-coated sheet metal box.

Circulation pump:

TA SHUNT can be equipped with Grundfos, WILO, Flygt etc. pumps as standard.

Non-return valve:

With spring-loaded valve disc.

Mechanical construction

General

TA SHUNT is made in all sizes from DN 20 to DN 100. In addition to the basic types, shunt valve types can be made to customer specification, such as larger than DN 100. Installation can be done in different ways, which gives considerable flexibility. Shunt valve groups can be installed upside down, for example. You just have to remember that the control valve spindle must never point downwards.

Shunt valve groups up to DN 50 are connected by means of pipe threads. DN 65 and larger are connected by means of flanged joints.

NOTE! Mating flanges are supplied for flanged joints.

Control valves

The shunt valve groups are designed for use with TAC AB control valves, but can also be ordered with other makes.

The specifications are found in the documentation provided by each make. Control equipment and actuators for control valves are not included.

Balancing

Primary and secondary circuits return pipes are provided with TA's balancing valves, STAD up to DN 50 and STAF as from DN 65. The valves have measurement points, draining (STAD) and also function as shut-off valves. When used for balancing and controlling media flow, please refer to the separate catalogue for STAD, STAF.

Shut-offs

Primary and secondary circuits inlet connections are provided with shut-off valves. For DN 20-50, shunt valve groups for heat are provided with ball valves with a raised lever. Shunt valve groups for cooling are provided with geared ball valves.

DN 65-100 are provided with ball-type gate valves.

Measurement connections:

The shunt valve groups are provided with measurement connections on the primary and secondary circuits inlet pipes, to permit measurement of available pressure and pressure drop in connected circuits.

Pump

TA SHUNT is normally delivered with a circulation pump for the secondary circuit. The pump is installed in the supply pipe outside the box, but inside the shut-off valve. The location outside the box makes the pump easily accessible for service or repair, and the pump motor gets good cooling, which also ensures longer endurance.

Threaded pumps are supplied ready installed in the valve groups. Flanged pumps are not mounted when supplied, in order to avoid making the valve groups unnecessarily bulky and heavy. Installation has been prepared by TA, however, and is easy to do on site with the installation components provided.

Shunt valve groups can also be supplied, prepared for pump installation, which means that the installation components accompany the pump. Finally, shunt valve groups can be supplied without either pumps or preparation for pumps.

Insulation - box

Shunt valve groups from DN 20 to DN 100 are insulated as standard with non-flammable mineral wool for heating systems and with Armaflex condensation insulation on shunt valve groups intended for refrigerant transmission systems.

External valves with couplings or flanges are not insulated.

The shunt valve groups are provided with a plastic-coated sheet metal box, which is easy to dismantle for inspection.

Mounting

A bracket for wall mounting is included as standard for all shunt valve groups. DN 65 and larger also have muffs underneath for support feet, if used. A floor mounting stand is available as an option, but the muffs for support legs are then omitted.

Type plate

A self-adhesive type plate is fixed to the front of the box. The type plate includes the following:

- Pos specifies the section of the installation which the shunt valve group serves
- Type gives the characteristic data of the shunt valve group
- Year of manufacture
- Max pressure and temperature
- Pump type and data are specified for pumps delivered with the shunt valve group
- Principle coupling is given, with a connection diagram

Document pocket

There is an A5-format document pocket on the rear of the shunt valve group.

Non return valve

In shunt valve groups where a non-return valve is included, it consists of a spring-loaded valve disc with low opening pressure and low forward pressure drop.

Thermometers

4 thermometers are installed in each shunt valve group. The thermometers for heating are graduated 0-120°C and for cold/heat recycling they are graduated -40°C - +40°C.

Draining

The shunt valve groups are equipped with a separate drain device, SAV with R1/2 for hose connection. If the shunt valve group is installed so that the SAV is uppermost, it can be used for venting.

Coding template

Calculation example

DN 20

- = Pressure drop with fully open balancing valve across
- Secondary circuit**
Principle coupling 1, 2 and 5.
 - Primary circuit**
Principal coupling 3, 4 and 6.

Background:

- A shunt valve group is to be connected to a heat exchanger with constant flow in primary and secondary circuits.
- The connection should be on the top of the shunt valve group for both primary and secondary circuits, with the primary circuit on the left.
- The shunt valve group shall be equipped with a circulation pump, 1x230V, in the secondary circuit.
- The shunt valve group shall be mounted on a floor stand.

- Primary coupling:

Available pressure 15 kPa

Required flow 0.3 l/s

- Secondary coupling:

Pressure drop across secondary side outside the shunt valve group with required flow = 20 kPa

Required flow 0.3 l/s

- Control valve: TAC 3-way

A proposed solution is given below, which moves forward one step at a time to derive coding which complies with the appearance of the coding templates. In the calculation example below, the unknown values are replaced by x, and are successively replaced by the derived values.

Coding: Vxxx-x.x/xxV-xx-0.30/xx-0.30/xx

Solution:

1 Start by choosing the principle coupling and version. Principle coupling 1, shunt valve group 11, complies with the background conditions.

Coding: Vxxx-x.x/xxV-11-0.30/xx-0.30/xx

2 Choose shunt valve group size. Flow 0.3 l/s gives size DN 20, please refer to the diagram. First read off the secondary pressure drop across the shunt valve group, with the balancing valve fully open, to 4.8 kPa.

Coding: Vxxx-x.x/20V-11-0.30/xx-0.30/4.8

3 Now select the control valve. The pressure drop shown by the slanting lines in the diagrams applies to the entire shunt valve group primary side i.e. both the control and balancing valves. Both valves are fully open.

The Kv values beside the slanting lines specify the Kvs values you should select for the control valve. They do not refer to the Kv value for the line they are on.

Go up in the diagram to the relevant flow, 0.3 l/s. Select the Kvs value for the control valve which gives the next lower pressure drop in the shunt valve group compared with available pressure. A Kvs value of 4.0 for the control valve gives a total pressure drop of 11 kPa on the primary side. This pressure drop is deducted from available pressure, 15 kPa. The difference, 4.0 kPa, is controlled by the balancing valve on the primary side. In the valve table, you see that the valve is referred to as V341. This has a threaded spindle end and can be motorised by most makes of control.

The entire coding can now be written:

Coding: V341-4.0/20V-11-0.30/11-0.30/4.8

This coding will be marked on the type plate and contains the following information:

- Type of control valve
- Kvs value
- Union dimension
- Type of insulation
- Connection procedure
- Projected primary flow
- Min necessary available primary pressure
- Projected secondary flow
- Secondary pressure drop across the valve group

4 Select pump for secondary circuit. Pump data is available from each manufacturer's catalogue.

The lift height which the pump must provide is determined by pipe losses and equipment outside the shunt valve group, plus the pressure drop across the secondary side of the shunt valve group with the balancing valve fully open. In the example, this gives 20 kPa plus 4.8 kPa i.e. 24.8 kPa. The flow should be 0.3 l/s. For example, select Grundfos pump UPS 25-40 130 1 x 230V. At 0.3 l/s, this gives 28 kPa.

Or select Wilo Star - RS 25/4 1x230V. At 0.3 l/s, this gives 30 kPa. The surplus pressure is controlled by the balancing valve on the secondary side.

5 Select any accessories, in this example one floor stand for DN 20.

6 Summarise the information:

1 shunt valve group, V341-4.0/20V-11-0.30/11-0.30/4.8

1 Grundfos pump, UPS25-40 130 1 x 230V, or Wilo Star - RS 25/4 1 x 230V

1 floor stand DN 20

Support material

Calculation program

TA SHUNT: Simplifies the choice of pump, control valve and balancing valve for shunt valve groups.

Manual

Manual no 1: Balancing of control circuits.

Principle coupling 1: Constant flow in primary and secondary circuit

TA SHUNT connection procedure 11, 12, 13, 14, 15 and 16.

For **conventional heating and ventilation systems** with main pump and where you want high return temperature to the boiler. This circuit is also used in **cooling installations and floor heating installations**. The flow in the secondary circuit can be greater than, or equal to the flow in primary circuit. The control valve functions as a mixing valve on the primary circuit return.

For other connection procedures than those below - please contact closest sales office.

Principle coupling 3: Variable flow in primary circuit and constant flow in secondary circuit

TA SHUNT connection procedure 31, 32, 33, 34, 35 and 36.

This shunt valve group is generally used in **installations without a main pump or in installations with low available pressure.** The control valve functions as a mixing valve in the inlet pipe.

NOTE! The following applies to dimensioning of the pressure drop diagrams: The primary side pressure drop applies to the secondary side. The secondary side pressure drop applies to the primary side. The flow should be equal in primary and secondary circuits.

P = Primary side

S = Secondary side

Principle coupling 4: Constant flow in primary and secondary circuit (Norwegian coupling)

TA SHUNT connection procedure 41, 42, 43, 44, 45 and 46.

Used for **shunting of heating or cooling water** in radiators, ventilation or cooling circuits etc. The connection is intended for systems with a main pump. The flow in the primary circuit can be greater than or equal to the flow in the secondary circuit. The control valve functions as a mixing valve in the secondary side inlet pipe.

NOTE! The following applies to dimensioning of the pressure drop diagrams: The primary side pressure drop applies to the secondary side. The secondary side pressure drop applies to the primary side.

For other connection procedures than those below - please contact closest sales office.

- a) Boiler or calorifier
- b) Heating group or air heater/cooler
- c) Main pump - primary
- d) Pump - secondary

Principle coupling 5: Variable flow in air inlet circuit and constant flow in air outlet circuit

TA SHUNT connection procedure 51, 52, 53, 54, 55 and 56.

This shunt valve group is intended for **heat recycling systems**. The control valve functions as a mixing valve in the primary side inlet pipe. When you dimension the pump, the dimensioning flow should be used in both heat exchangers. The pump must be able to manage the pressure drop across both heat exchangers, the pipe system and the control valve.

NOTE! Seal Q for V395 in this connection.

For other connection procedures than those below - please contact closest sales office.

- e) Heat exchanger in air inlet duct
- f) Heat exchanger in air outlet duct
- g) Pump
- h) Expansion vessel

Principle coupling 6: Variable flow in primary circuit and constant flow in secondary circuit (Sabo coupling)

TA SHUNT connection procedure 61, 62, 63, 64, 65 and 66.

This shunt valve group is used in **low flow systems** with large temperature differences and low pressure drop in the shunt valve group.

NOTE! The following applies to dimensioning of the pressure drop diagrams: The primary side pressure drop applies to the secondary side. The secondary side pressure drop applies to the primary side. The control valve functions as a mixing valve in the inlet pipe.
